Research

Statistics/ML

Bayesian statistics • Evidence synthesis • Gaussian processes • Bayesian nonparameters • MCMC • Variational inference • Time series • Active learning • Deep learning • Network inference • Graphical models • Dynamical Systems

Biology/Medicine

Gene regulation • Protein structure • Stem cells • Single cells • Biomarkers • Intensive care data

Computer science

Combinatorial optimisation • Algorithmic geometry • Graph theory

Education

Professional Accreditation of Teaching in Higher Education

2002 | University of London

PhD in Mathematics

1990–1994 | Freie Universität Berlin
Dominance order on point sets and aligned rectangles

BSc/MSc in Mathematics

1982–1989 | Universität Wien
Dimensions of posets and comparability graphs, with *Distinction*

Study of Philosophy

1979–1982 | Universität Wien

Skills

Leadership

- 18 years experience in leading a research group (up to 6 members)
- 7 years experience as a MSc course (Bioinformatics) director
- 11 years leading a Medical Research Council programme of research

Research

- Broad range of expertise in mathematical, computational, and statistical modelling, theoretical as well as applied
- Contributions to conceptual advances in Bayesian statistics
- 30+ years experience in algorithm and software development and implementation in a variety of frameworks (Bugs, Stan, Cuda, Tensorflow) and languages (Assembler, Lisp, C++, Java, R, Python) on various computational platforms (from early transputer to GPU systems)

Training

- 25+ years experience in teaching mathematics, statistics, bioinformatics, computing
- For 7 years principal lecturer on an MSc course in Bioinformatics, Birkbeck College, London, now contributing to the MPhil Computational Biology course at Cambridge University
- Supervision of 12 successful PhD students and countless MSc students

Management

- Grant management as principal investigator
- Collaborative research projects with biologists, medical researchers and clinicians

Experience

Programme leader, statistical genomics

since 4/2007 | Medical Research Council, Biostatistics Unit | Cambridge
Leading a programme on computational biology and statistical genomics.

Lecturer/Reader/Professor in Computational Biology

10/1999–3/2007 | Birkbeck College | University of London
Developing research programmes on protein structure analysis, microarray analysis, gene regulation and network inference.

Research scientist

10/1996–9/1999 | EMBL European Bioinformatics Institute | Cambridge
Developing algorithms and software for the analysis of protein structure interfaces and optimisation of peptide binding.

Research assistant and postdoctoral fellow

5/1990–9/1996 | Department of mathematics, Freie Universität Berlin
Working on algorithmic geometry and discrete optimisation problems. Teaching on undergraduate computer science courses.

Software developer

4/1987–4/1990 | Elin ALCATEL-Austria Research Center Wien
Lead developer of a system acquiring test data from electric motors, later contributing to the development of knowledge based inference engine on parallel transputer systems.

Current research themes

Evidence synthesis

There is growing interest in analysing large heterogeneous data sets jointly, that provide different views on common underlying features. We have recently proposed a principled framework to merge separate Bayesian models, each tailored to a specific data set, into one model through common parameters (Goudie et al., 2018). A key requirement is the ability to estimate densities. We are exploring the potential of deep learning approaches, such as normalising flows, to provide detailed density estimates even for sparse data in high dimensions and the integration of such estimations into Monte Carlo sampling from or variational optimisation of Bayesian models. Another aspect of integrating heterogeneous data is the restriction of the flow of information through a so called 'cut' in a Bayesian model. There has been much debate about its meaning and we are developing a principled framework for such operator based on variational inference. The ability to estimate densities reliably plays a key role in this approach.

Design of experiments using active learning

Controlled differentiation of stem cells is driven by careful administration of stimulating factors to cell cultures. The exact amount and timing of such stimulation is largely a matter of trial and error. We propose an active learning framework implemented in Tensorflow to optimise such dynamic experiments. Since, unlike the typical situation for many tasks in reinforcement learning, the number of possible experiments is extremely limited, modelling of the dynamics through Gaussian process state space models (instead of a vanilla neural networks) is crucial. In simulations of realistic systems we achieve remarkable optimisation results with only a limited number of experiments (see [this talk at Costnet18](#)). Some earlier work on active learning for gene networks is described in Pournara and Wernisch, 2004.

Prediction in intensive care

With the increasing availability of health care data, including measurements of biomarkers, there is growing interest in the prediction and the understanding of adverse events such as a secondary infection of patients in intensive care. Modeling of trajectories as well as the dynamics through Gaussian processes is a promising route we apply to the prediction of secondary infections as well as the long-term effect of traumatic brain injury. A key step is the understanding of the causal relationship of components of the immune response. We explore how far concepts of NLTSA (non-linear time series analysis) such as convergent cross mapping (Sugihara et al. 201)

can be put on a firm probabilistic basis and used for this purpose. Details can be found in a [tutorial on ML for ICU data](#).

Nonparametric approaches to single cell data

Transcriptomics data from single cells pose a unique challenge in that, although measurements from thousands of samples are available knowledge of their temporal ordering is typically very limited. In a series of studies (Strauß et al., 2018, Gabasova et al., 2017, Reid and Wernisch, 2016, Penfold et al., 2018) we derive pseudo-time orderings and clusterings using Gaussian processes and Dirichlet process priors. We are now exploring how far such reconstructed gene expression trajectories can be exploited for network inference (some examples given in [a talk on single cell analysis](#)). We have also expanded the approach of Gabasova et al., 2017, to a generic framework for clustering using hierarchical Dirichlet distributions.
